

General: How do I generate a build config from a running cluster?

This article describes how to generate a build config (which can be fed into the Bright head node installer) from a running cluster configuration.

Prerequisites

This works only for Bright 7.0 and newer versions.

Generate build config

1. Run the script `cm-create-buildconfig`
`module load cluster-tools`
`cm-create-buildconfig`
2. Follow instructions (if any) at the end of script execution.
