

NVIDIA DGX: Can I run a DGX node using a standard Bright software image?

In order to be able to get support from NVIDIA, it is necessary to run the official DGX software stack. Bright provides the official DGX software stack for Ubuntu 18.04 in the form of a Bright software image. For RHEL, it is possible to add the DGX packages to a standard Bright software image.

Using a standard Bright software image is also possible, but NVIDIA DGX support may decline to support the configuration.
