

Cluster Management: How can I reduce the size of cmdaemon and node installer logs?

By default, cmdaemon, node installer and some other Bright Cluster Manager logs are handled with `logrotate`. The options for these can be set in:

```
/etc/logrotate.d/cmdaemon
```

The `logrotate` command has several options (`man logrotate`) to handle unfeasibly large logs.

Options to consider are: compressing older log files, reducing the number of days that are logged, or the size of each log.

For example:

```
/var/spool/cmd/event.log {  
    monthly  
    size=1G  
    missingok  
}
```

This rotates `event.log` monthly, allows a maximum log size of 1GB, and if the log file doesn't exist, skips the log file without an error message.
